

Distribution Flexibility Services Procurement Report 2025/2026

1. Introduction

mua Electricity Limited (MUAE) is a Licenced Independent Distribution Network Operator (IDNO) who own and operate one IDNO licensed Multi Utility Asset business (mua).

Our networks are situated across all Grid Supply Point (GSP) areas of Great Britain and are connected to upstream distribution networks (DNO).

Mua owns and operates 'final mile' connections on new build residential and commercial developments and Electric Vehicle Charger (EVC) sites around the UK, built as extensions to the existing Electricity Distribution Network Operator (DNO) Networks. All our current and planned network assets are new assets, with our oldest asset networks being less than six years in situ. The majority of our contracted sites are still under construction and the vast majority of which are 11kV or below. Our networks are designed to consider the load requirements of a new development and consider both import and exports loads based on the Developments agreed planning requirements and constraints inclusive of any embedded generation needs and future loads.

As a consequence of their relatively new age and being designed to meet the needs of a new development, they operate within their load requirements, and none have been found to require reinforcement in the past year. We therefore do not have any current need to procure flexibility services to support the operational needs of our networks. We monitor this situation regularly to understand whether the needs of our customers are changing and maybe having an impact on our networks.

2. Flexibility Procurement and Use Summary

No flexibility services were procured in the past year.

3. Stakeholder engagement

As we did not have a requirement for any flexibility services we did not engage with any stakeholders on this issue.

4. Economic viability

We did not require any reinforcement activity on our networks in the past year. We therefore did not have to undertake any economic viability modelling of whether flexibility would have provided a viable alternative option.

5. Carbon reporting

As we did not contract for any flexibility services, we do not have any carbon assessments to report upon. We are members of the ENA and are aware of the collaborative work that has been ongoing between the DNO and the ESO to agree a common methodology to use to calculate carbon intensity and emissions. If we were to procure flexibility services our intention would be to align with the DNO/ESO and use the common methodology. We are also members of the INA, and we keep in active conversation with other IDNO network adopters on any best practices and of any changes within industry that would be of benefit to any such tender we would look to progress.
